[Remarks from the Examiner]

Claims: 1 to 3

References: 1, 2

Remarks:

The cited reference 2 describes that, in a planetary gear bearing lubrication system in which pinion gears are rotatably retained via bearings by pinion pins, an oil sump is formed at a location corresponding to the axial end of the pinion pins in order to store the lubricating oil that runs down along an oil passage into the oil sump, and is intercommunicated with the bearings of the pinion pins. A person skilled in the art would have easily devised a technology to apply the aforementioned configuration described in the cited reference 2 to the planetary gear bearing lubrication system described in the cited reference 1, so as to achieve the invention as described in claims 1 and 2 of the present application.

Further, it is within a range of design variation for a person skilled in the art to change a configuration of the oil sump so that a supply amount of the lubricating oil is adjusted, as claimed in claim 3 of the present application.
